Archon Solutions

PRACTICE ORGANIZATION

Novocare Technologies Pvt. Ltd.

Implementation & Hands-on Reference

PROJECT BUSINESS CONTEXT & OBJECTIVES

Novocare Technologies Pvt. Ltd. is a fast-growing, mid-sized technology and business operations enterprise headquartered in Hyderabad, India, with a projected workforce scaling rapidly across multiple business units (Technology, Corporate Services, and Sales & Marketing). The organization is experiencing aggressive workforce expansion. To sustain this hyper-growth without administrative friction, Novocare required a modern, agile, and compliance-ready Core Human Resources Information System (HRIS).

The Core Business & Operational Challenges

As Novocare scaled past its startup phase, its legacy HR practices introduced critical operational vulnerabilities:

- Regulatory Compliance Risks: Managing a diverse workforce in India exposed the company to statutory complexities. HR lacked automated data validation for mandatory Indian statutory identifiers such as PAN, GST, CIN, and state-specific labour codes-raising compliance risks.
- Approval Bottlenecks & Operational Delays: Internal employee transfers, promotions, and job changes routinely stalled in linear, unmonitored approval chains. Without automated escalation paths, HR operations faced severe bottlenecks that frustrated both employees and managers.
- Fragmented Asset & Lifecycle Management: Onboarding new hires involved manual, disconnected handoffs. Specifically, tracking company-issued assets (such as laptops and equipment) required separate spreadsheets, creating an audit blind spot between HR and IT operations.
- Data Inconsistency: Manual data entry for employee profiles and naming conventions led to reporting inaccuracies and fragmented employee records.

The Solution: An End-to-End SAP SuccessFactors Implementation

To address these business hurdles, this practice project designed, configured, and deployed a robust, production-grade Core HR architecture utilizing SAP SuccessFactors Employee Central. The implementation directly aligns technical configurations with strategic business outcomes:

- Localized Compliance: Deployed the Country-Specific Corporate and Succession Data Models (India) to enforce statutory validation at the database level, ensuring automated compliance for regional tax and corporate structures.
- Automated Workflow Governance: Built intelligent multi-step workflows featuring time-bound 3-day automated escalations (routing unapproved requests to Manager-Managers or HR) to eliminate administrative drag and accelerate internal mobility.
- Integrated Asset Governance: Designed custom Metadata Framework (MDF) objects (cust_NCTAssetTest) that bridge HR and IT, allowing seamless tracking of company property directly alongside the employee's onboarding profile.
- Data Integrity & Streamlined Lifecycle: Configured custom picklists (NCT_EMPLOYMENT_TYPE), automated OnSave business rules for error-free naming conventions, and tailored Hire Templates to ensure clean, standardized data entry from Day 1.
- Secure Enterprise Access: Implemented strict Role-Based Permissions (RBP) adhering to the Principle of Least Privilege, segmented by precise dynamic groups and target populations to protect sensitive employee records.

Business Impact: This implementation transforms Novocare's HR function from a transactional administrative unit into a strategic, automated, and audit-ready powerhouse, demonstrating an end-to-end mastery of SAP SuccessFactors Employee Central configuration and real-world problem-solving.

KEY CONFIGURATION AREAS

01 | DATA MODEL ARCHITECTURE

- Corporate Data Model & Country-Specific Corporate Data Model (India)
- Succession Data Model & Country Specific Succession Data Model
- XML Structure and configuration

02 | ORGANISATIONAL STRUCTURE & FOUNDATION OBJECTS

- Legal Entity, Business Unit, Division and Department
- Location, Cost Centre, Pay Grades and Organizational Associations
- Foundation Object configuration and effective dating

03 | PICKKLIST CONFIGURATION

- Definitions, Custom Picklist (NCT_EMPLOYMENT_TYPE), and Usage

04 | MDF & CUSTOM OBJECT DEVELOPMENT

- MDF object configuration and field definitions
- Custom MDF object creation (Asset Tracking) and associations
- Object properties and relationship configuration

05 | EMPLOYEE LIFECYCLE MANAGEMENT

- Hire Template configuration
- Employee hiring process & Data entry
- Job Information & People profile verification

06 | BUSINESS RULES AND WORKFLOW CONFIGURATION

- Business Rule Configuration (NC_Name, NC_display_name)
- Workflow Configuration & Approval Routing (NC_Transfer)
- Dynamic role & Dynamic group
- Escalation Configuration (NC_Escalation)
- Business Impact & Value Delivered

07 | ROLE-BASED PERMISSIONS (RBP) AND SECURITY ADMINISTRATION

- Permission Role Configuration
- Permission Group Configuration
- Permission Role Grants & Target Populations
- RBP Troubleshooting and Access Validation

08 | POSITION MANAGEMENT CONFIGURATION

- Configuration of Position Object & Position Hierarchy
- Position-to-Job Sync Rules

09 | USER EXPERIENCE (UX), BRANDING & SYSTEM CUSTOMIZATION

- BCUI (Business Configuration UI) and Home Page Customization
- Banner Images, Quick Actions, and Visual Themes

10 | DATA MANAGEMENT, IMPORT/EXPORT & VALIDATION

- Employee and Configuration Data Import/Export Framework
- Configuration Validation, Functional Testing, and Result Verification

01. DATA MODEL ARCHITECTURE

Project: Novacare Technologies Pvt Ltd.
Module: SAP SuccessFactors Employee Central

Overview

The data model defines how data elements are structured, what properties they contain, and how they relate to one another in SAP SuccessFactors Employee Central. It provides the configuration framework for representing organisational information, employee-related information and country-specific requirements.

Employee Central uses different data models for different configuration purposes. This section focuses on the Corporate Data, Country/Region-Specific Corporate Data Model, Succession Data Model and Country Specific Succession Data Models. Explaining their roles in defining organisational data, foundation objects and country-specific configuration.

The illustrations and evidence presented in this section are intended to demonstrate my understanding of the data model architecture as part of the Novacare Technologies practice implementation.

1.1 Corporate Data Model (CDM)

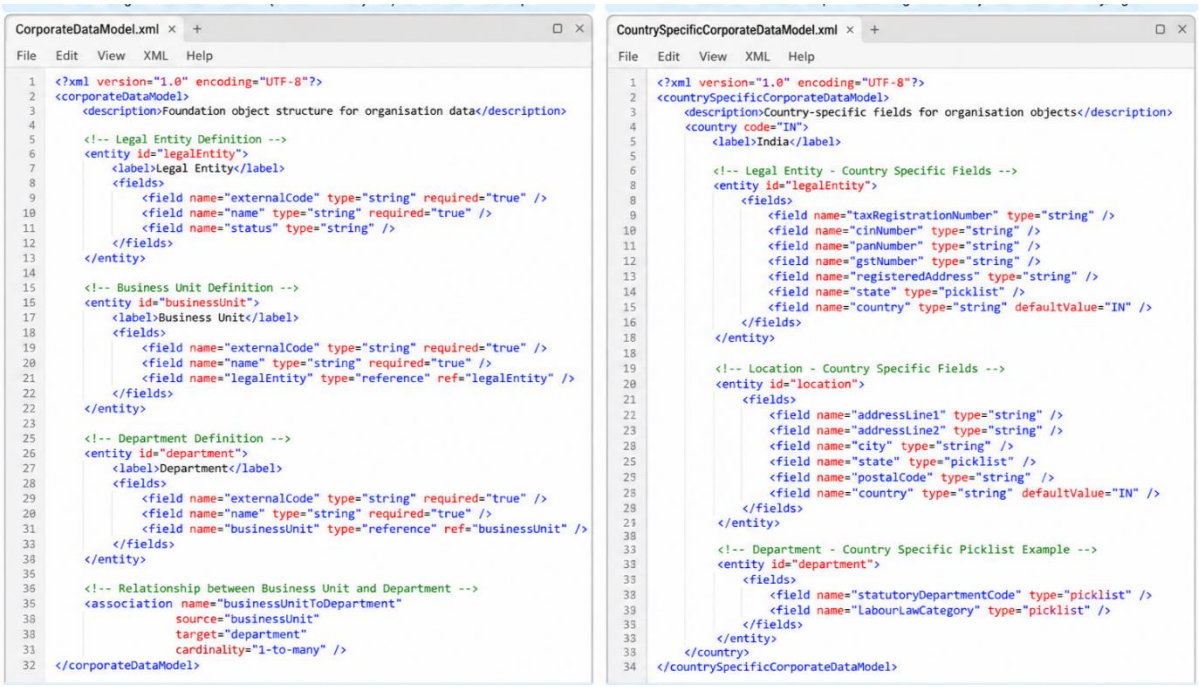

The Corporate Data Model defines the structure and configuration of organization-related data in Employee Central. It supports foundation objects used to represent the organization's structure, job structure, and pay structure, while defining critical relationships between these objects.

For Novocare Technologies Pvt. Ltd., the Corporate Data Model forms the architectural backbone for configuring foundational organizational elements, including:

- Legal Entity (establishing Novocare's primary corporate registration)
- Business Units (structured across Technology, Corporate Services, and Sales & Marketing)
- Divisions and Departments (mirroring Novocare's internal reporting lines)
- Locations and Cost Centres (such as the Hyderabad office operations and product cost allocation)
- Job Classifications and Pay-Related Foundation Objects

Business & Technical Context: The Corporate Data Model is XML-based. During implementation, these structures were carefully defined to ensure that when actual organizational records are created (such as setting up the Hyderabad office or assigning department cost centres), they adhere strictly to a standardized global and local framework. Understanding this distinction-separating structural definition in XML from operational record creation in the instance ensures clean data governance as Novocare scales.

Figure 1.1 — Corporate Data Model XML Structure

                <field name="taxRegistrationNumber" type="string" />
                <field name="cinNumber" type="string" />
                <field name="panNumber" type="string" />
                <field name="gstNumber" type="string" />
                <field name="registeredAddress" type="string" />
                <field name="state" type="picklist" />
                <field name="country" type="string" defaultValue="IN" />
            </fields>
        </entity>

        <!-- Location - Country Specific Fields -->
        <entity id="location">
            <fields>
                <field name="addressLine1" type="string" />
                <field name="addressLine2" type="string" />
                <field name="city" type="string" />
                <field name="state" type="picklist" />
                <field name="postalCode" type="string" />
                <field name="country" type="string" defaultValue="IN" />
            </fields>
        </entity>

        <!-- Department - Country Specific Picklist Example -->
        <entity id="department">
            <fields>
                <field name="statutoryDepartmentCode" type="picklist" />
                <field name="LabourLawCategory" type="picklist" />
            </fields>
        </entity>
    </country>
</countrySpecificCorporateDataModel>
```

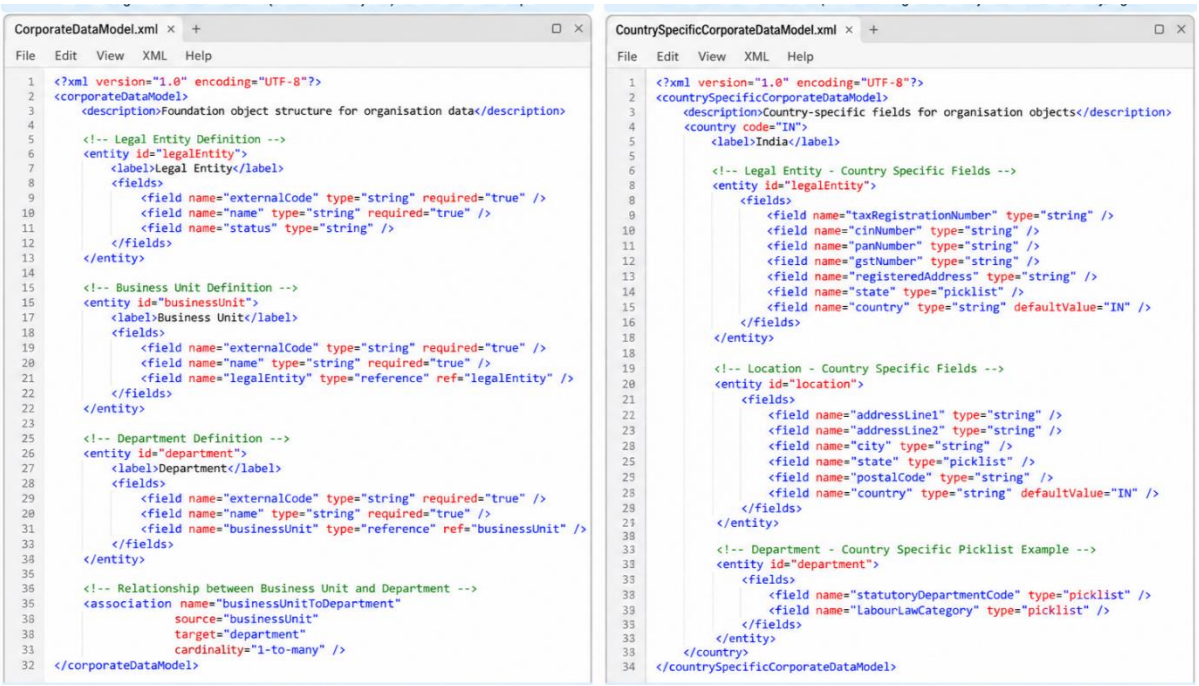

1.2 Country/Region-Specific Corporate Data Model

The Country/Region-Specific Corporate Data Model extends the core corporate configuration with fields, formats, and picklists tailored to specific regulatory jurisdictions. It handles critical country-specific statutory and compliance requirements related to corporate and organizational data.

For Novocare Technologies Pvt. Ltd., this model was leveraged to maintain localized company information for its Indian legal entity and regional offices. Aligned with standard delivery and statutory mandates, this configuration incorporates:

- Country-Specific Legal Entity Fields: Capturing vital Indian regulatory identifiers such as Permanent Account Number (PAN), Goods and Services Tax Identification Number (GSTIN), Corporate Identification Number (CIN), and Tax Registration Numbers.
- Localized Address & Location Formats: Standardizing corporate address structures, states (via picklists), and postal codes mapped specifically to India (country code="IN").
- Local Classifications: Defining statutory department codes and labour law categories to ensure local compliance.

Figure 1.2 — Country-Specific Corporate Data Model XML

CorporateDataModel.xml

```xml

            <fields>
                <field name="statutoryDepartmentCode" type="picklist" />
                <field name="LabourLawCategory" type="picklist" />
            </fields>
        </entity>
    </country>
</countrySpecificCorporateDataModel>
```

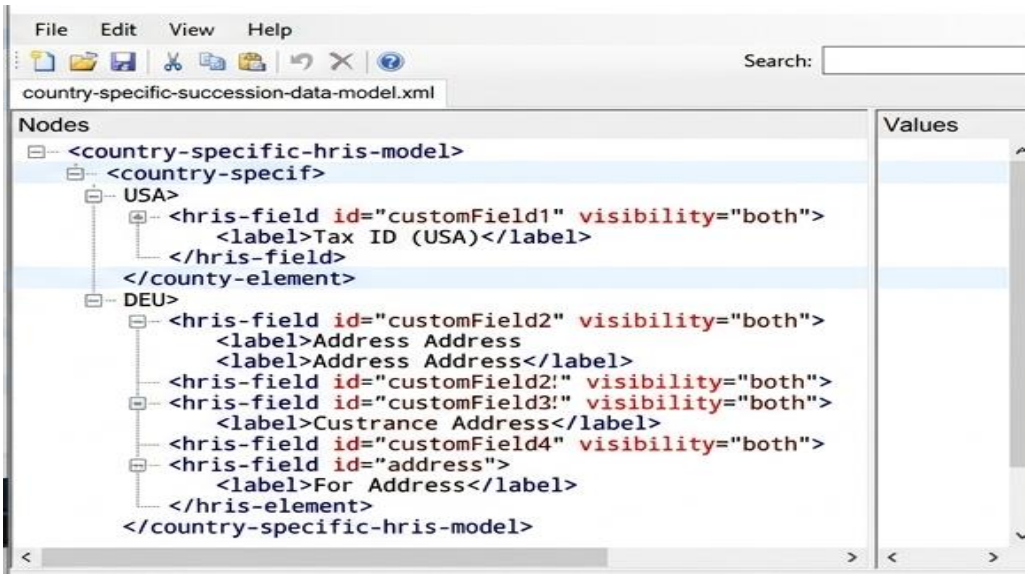

1.3 Succession Data Model (SDM)

- Purpose: Manages the core global employee profile, employment details, and historical data structures across the organization.
- Key Elements: Controls essential hris-element blocks, including personal information (personalInfo), employment details (employmentInfo), job data (jobInfo), compensation structures (compensationInfo), and user login credentials.
- Key Responsibilities: Governs field-level security and data integrity by configuring field visibility (both for editable/viewable, view for read-only, and not-visible), defining mandatory field rules, setting field length limits, and applying data type validations.

1.4 Country-Specific Succession Data Model (CSSDM)

- Purpose: Captures regional, statutory, and compliance-driven personal data fields required by local labor laws and regional regulations.
- Key Elements**:** Manages country-specific personal details, including localized National IDs (such as PAN and statutory identifiers tailored for the Indian entity), local address formats, tax details, and emergency contact country variants.

1.5 XML Structure & Configuration Artifacts

SuccessFactors data models are strictly governed by Document Type Definitions (DTDs) via XML. Key structural artifacts include:

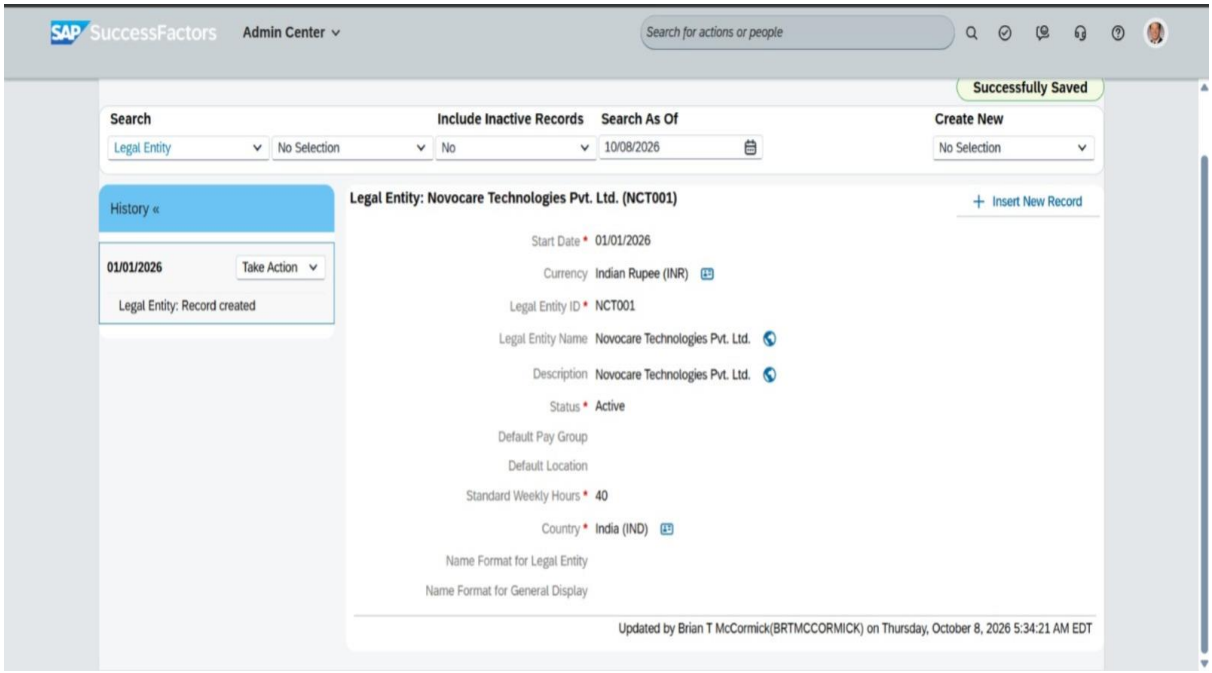

- hris-element & hris-field: The foundational building blocks defining data blocks and individual fields.
- Visibility Attributes: Managing field accessibility (both for edit/view, view for read-only, and not-visible to hide).
- Associations & Picklists: Linking parent-child objects (e.g., Department tied to Division) and standardizing drop-down options.
- Provisioning & Version Control: Uploading validated XML files into Provisioning and aligning them with Role-Based Permissions (RBP).

02.ORGANIZATION STRUCTURE AND FOUNDATION OBJECT CONFIGURATION

Project: Novacare Technologies Pvt. Ltd. | **Module:** SAP SuccessFactors Employee Central

Overview Foundation Objects form the structural backbone of organizational and job-related data in SAP SuccessFactors Employee Central. In this implementation, key organizational objects were configured to establish Novocare's corporate hierarchy, reporting lines, and supporting operational infrastructure.

2.1 Legal Entity Configuration

Navigation Path: *Admin Centre > Manage Data > Create New > Legal Entity > Enter Details > Save > Verify Record*

Objective: To establish the primary corporate legal entity representing Novacare Technologies Pvt. Ltd. (NCT001) within the practice environment.

Configuration Areas:

- Legal entity name (Novacare Technologies Pvt. Ltd.) and external code (NCT001)
- Effective start date (01/01/2026) and status (Active)
- Statutory and organizational attributes, including currency (INR), standard weekly hours (40), and country assignment (India)

Validation: Reviewed the saved legal entity record to verify that all organizational details and country parameters were accurately mapped.

2.2 Organisational Structure

Navigation Path: *Home > Company Info > Company Structure Overview > Select Company Structure > Select Object Type > Select Organization Record > View Hierarchy*

Objective: To establish and visualize the multi-level organizational hierarchy of Novacare Technologies.

Configuration Areas:

- Business Units: Establishing primary operational pillars (Technology, Corporate Services, and Sales & Marketing).
- Divisions: Grouping specialized functions under each business unit (e.g., Engineering, Human Resources, Finance, Enterprise Sales).
- Departments: Detailing granular operational teams (e.g., Software Engineering, Quality Assurance, Talent Acquisition).

- Parent-Child Relationships & Associations: Linking departments to divisions and divisions to business units to ensure clean reporting structures.

Validation: Reviewed the saved foundation object records and verified the structural chart via the Company Structure Overview tool to ensure proper parent-child mapping.

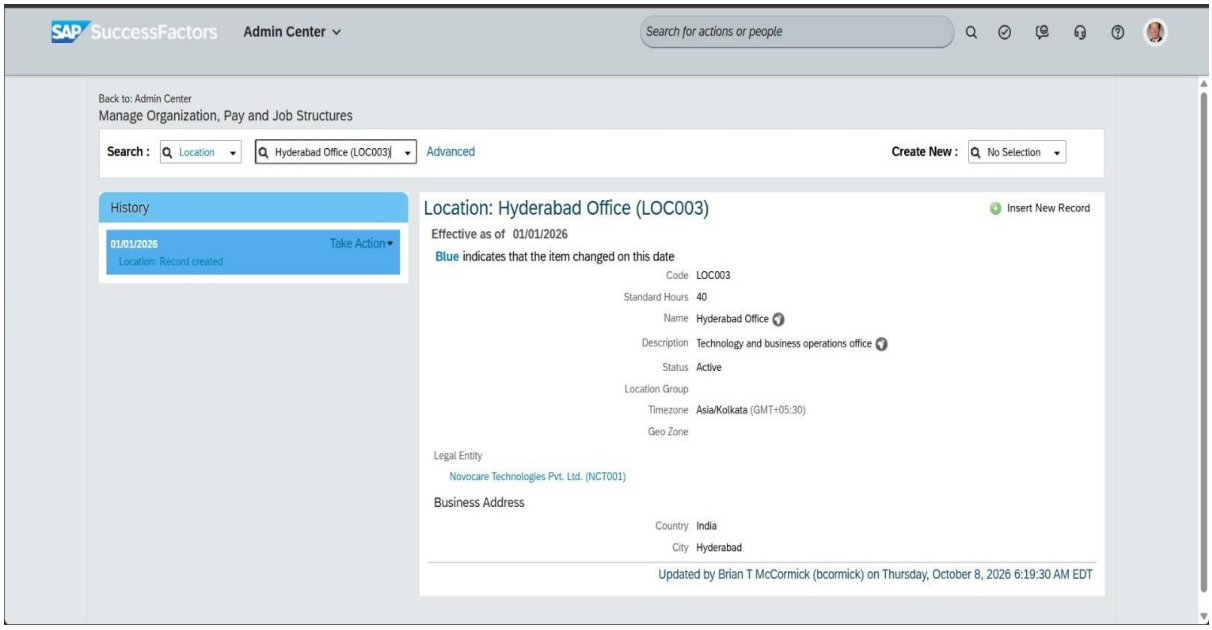

2.3 Supporting Foundation Objects

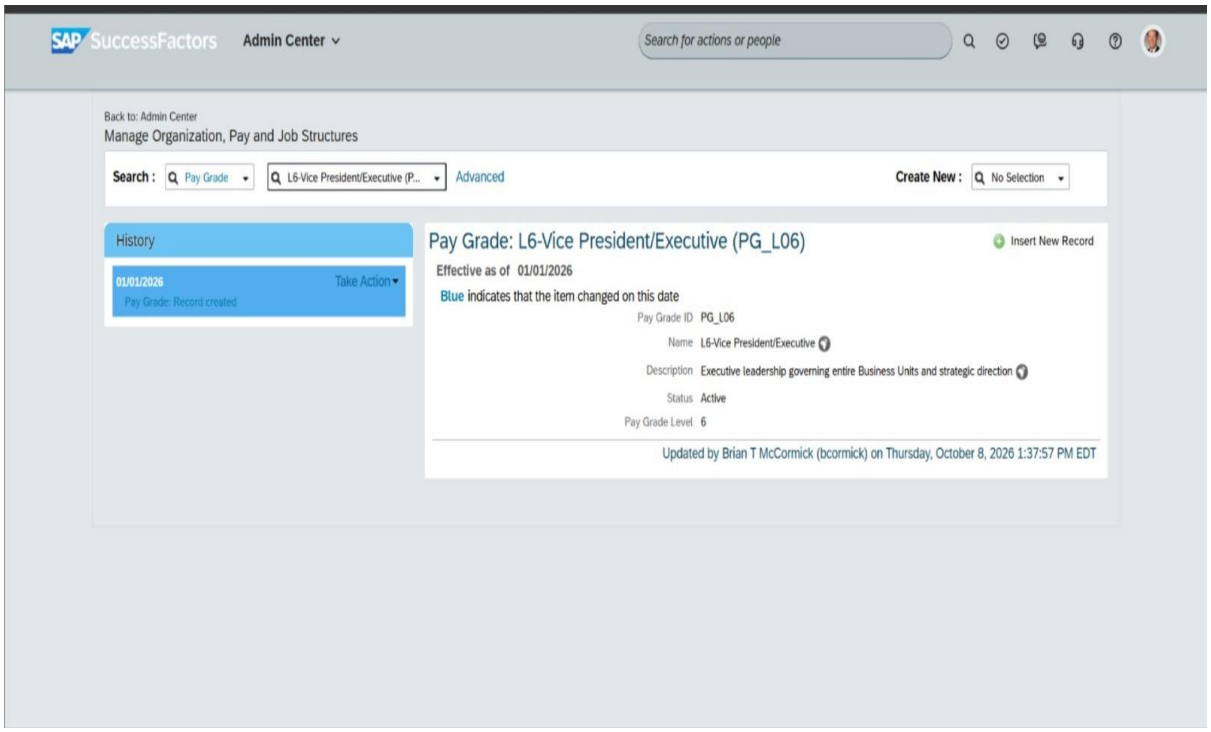

Objective: To configure supporting organizational, cost, and job-related foundation objects within the Novacare Technologies practice environment.

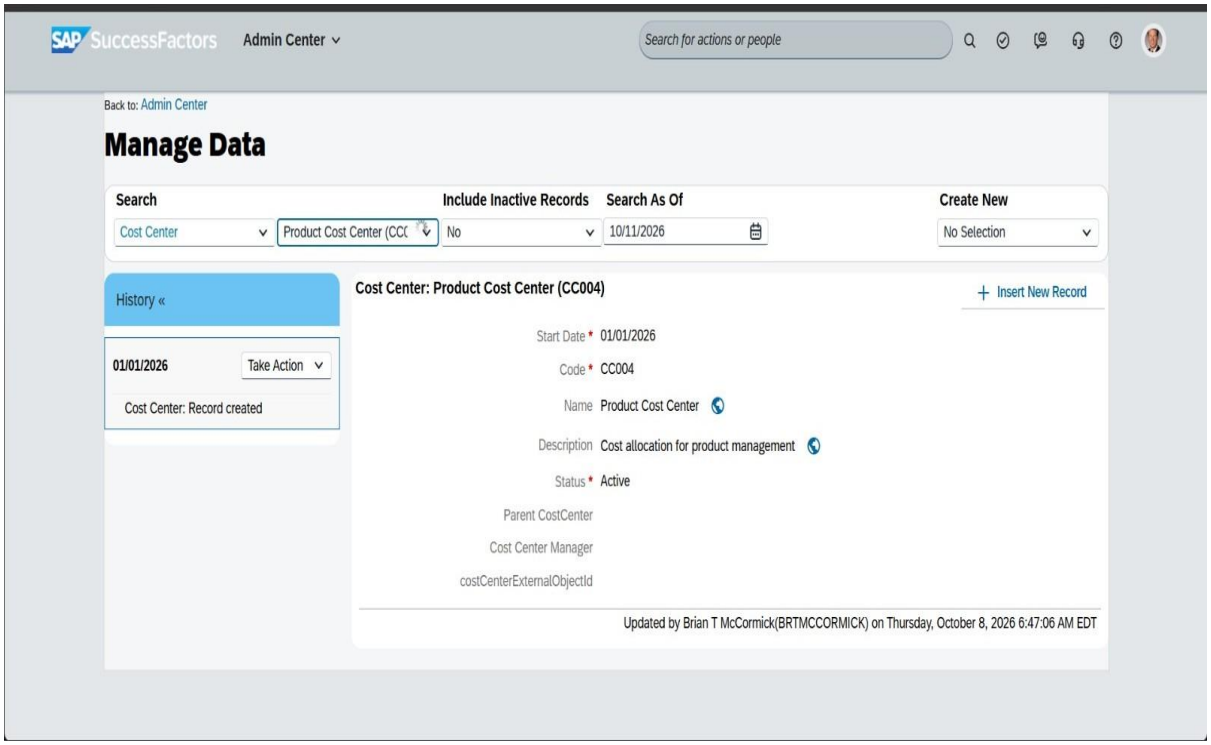

Configuration Areas:

- Locations: Setting up office infrastructure (such as the Hyderabad Office LOC003, defining time zones like Asia/Kolkata, standard weekly hours, and business addresses).
- Pay Grades: Establishing executive and operational pay structures (such as PG_L06 for Vice President/Executive leadership).
- Cost Centres: Configuring financial allocation objects (such as CC004 for Product Cost Centre) to ensure proper cost tracking and department budgeting.
- Business Units, Divisions, & Departments: Maintaining foundational relationships across the enterprise.

Validation: Reviewed the saved records in Manage Data and Manage Organization, Pay and Job Structures to verify configured field values, effective dates, and applicable parent-child associations.

03. PICKLIST CONFIGURATION

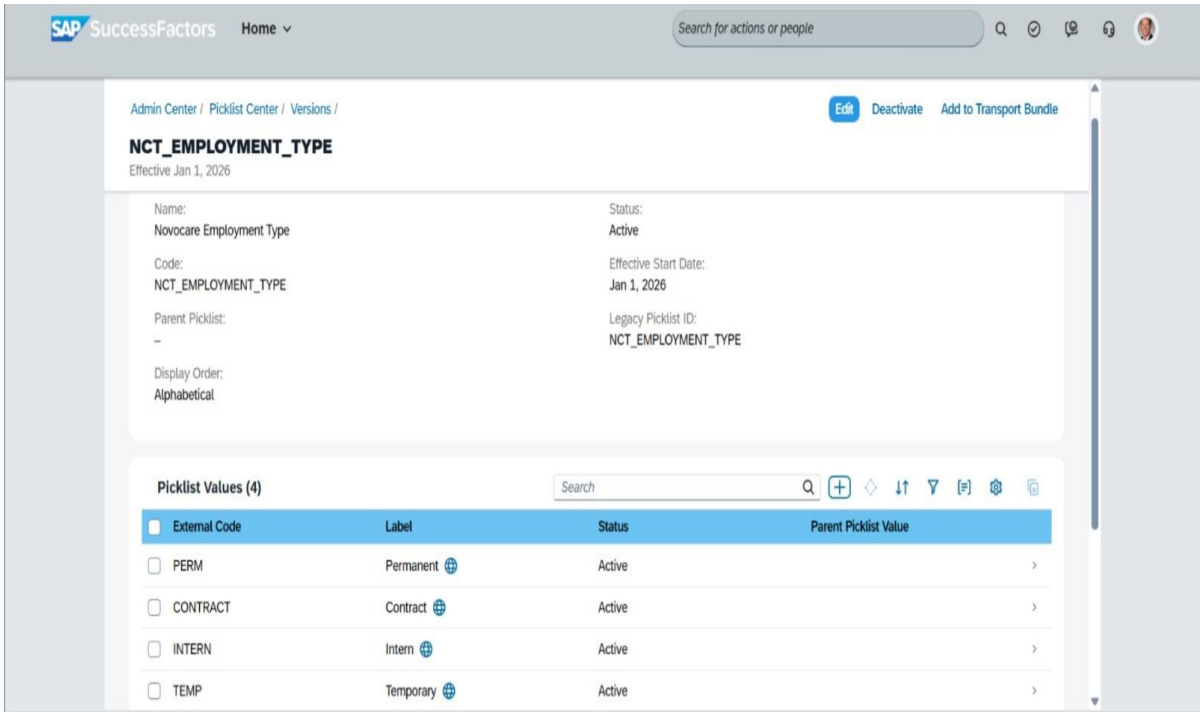

Project: Novacare Technologies Pvt ltd | Module: SAP SuccessFactors Employee Central

Overview: Picklists are utilized in SAP SuccessFactors Employee Central to provide predefined selectable values for supported fields, maintaining data consistency and eliminating errors caused by manual, free-text data entry.

Navigation Path:

Admin Centre > Picklist Centre > + (Create New) > Enter Picklist Code, Name, Effective Start Date & Status > Save > Add Picklist Values (+) > Enter External Code, Label & Status > Create > Verify Picklist Values.

Figure3:1: Custom Picklist Configuration — Employment Type

04. MDF CUSTOM OBJECT CONFIGURATION

Project: Novacare Technologies | Module: SAP SuccessFactors Employee Central

Overview

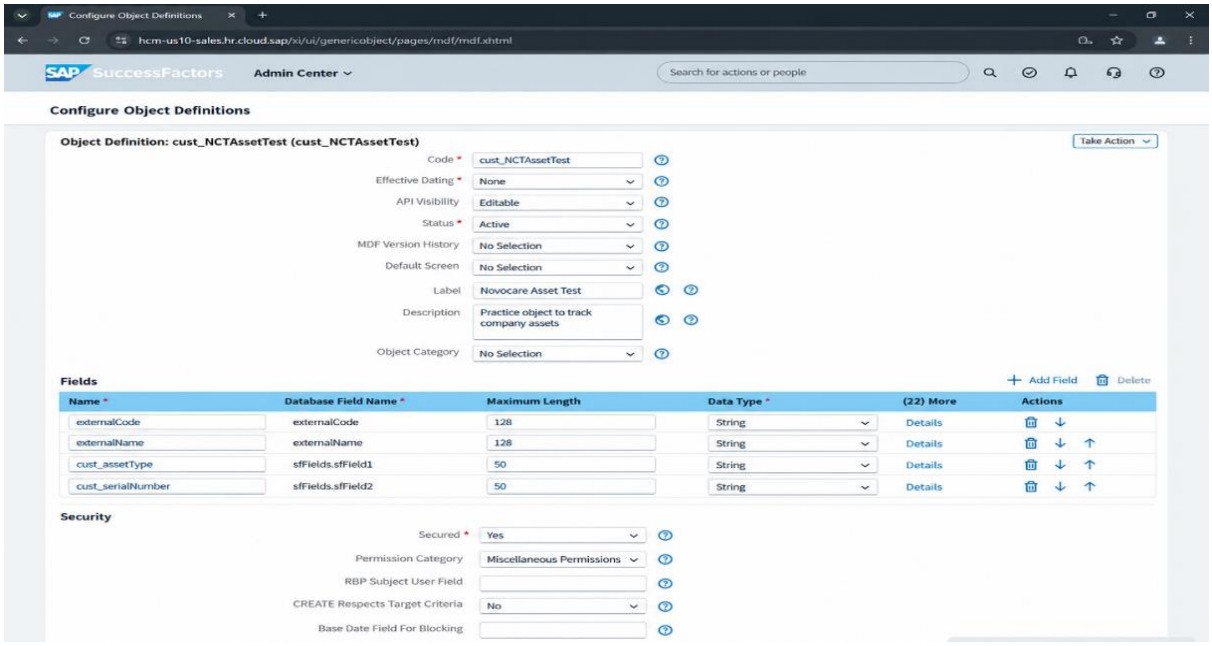

The Metadata Framework (MDF) in SAP SuccessFactors enables administrators to build and manage custom, highly configurable objects tailored to unique business needs. This section documents the creation of a custom MDF object to track corporate assets (such as company laptops) issued to employees during onboarding.

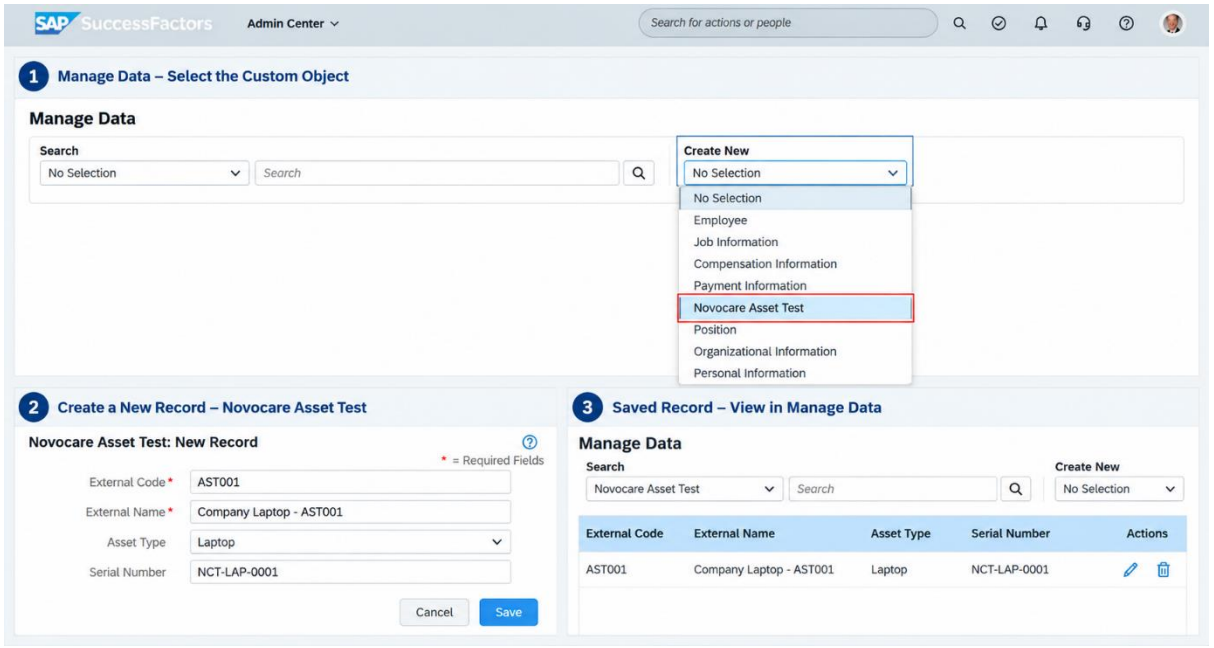

Configuration & Navigation Steps:

1. Object Definition Setup: *Admin Centre > Configure Object Definitions > Create New > Object Definition > Enter Code (cust_NCTAssetTest), Label (Novocare Asset Test), & Description.*
2. Properties & Fields: Configured effective dating (None), API visibility (Editable), status (Active), and added custom fields including cust_assetType and cust_serialNumber.
3. Security Administration: Configured object-level security (Secured = Yes), assigned it to Miscellaneous Permissions, and updated Manage Permission Roles to grant appropriate view and edit access to authorized users.
4. Data Creation & Testing: *Admin Centre > Manage Data > Create New > Novocare Asset Test > Entered test record data* (e.g., Code: AST001, Name: Company Laptop - AST001, Asset Type: Laptop, Serial Number: NCT-LAP-0001) and verified the saved record.

Business Value:

Bridges the operational gap between HR and IT by tracking physical equipment allocations directly within the SuccessFactors environment, improving accountability and audit readiness.

05. EMPLOYEE LIFECYCLE MANAGEMENT

Project: Novak Technology | Module: SAP SuccessFactors Employee Central

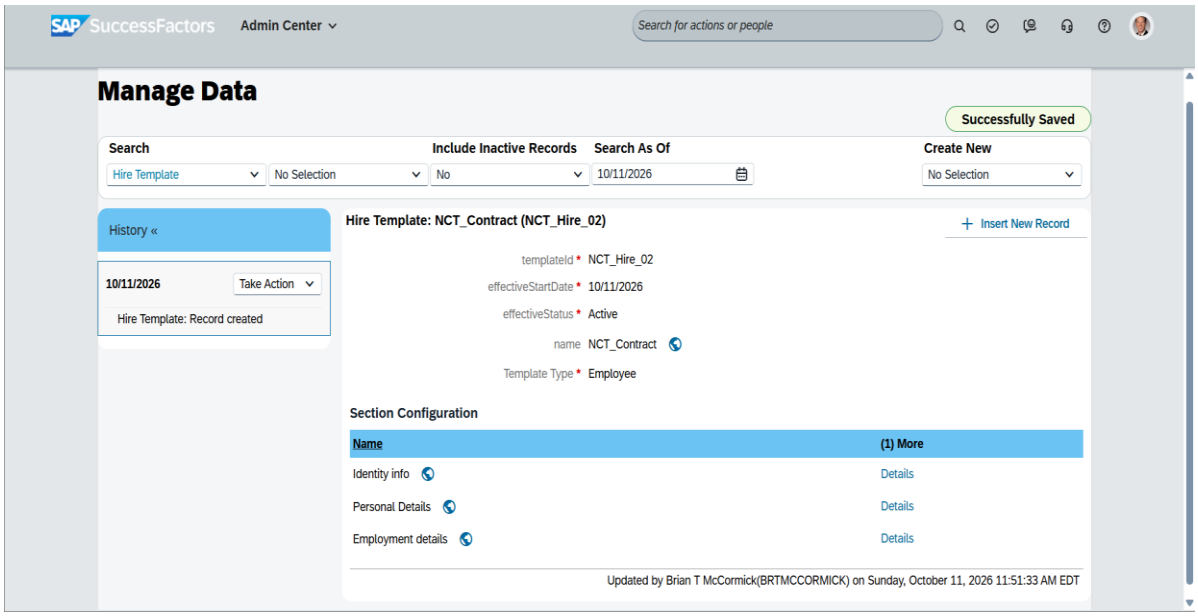

Overview & Business Context

Employee Lifecycle Management in SAP SuccessFactors Employee Central governs the continuous journey of a workforce spanning initial recruitment intake, structured onboarding, and day-to-day employment record maintenance.

At Novocare Technologies Pvt. Ltd., managing a rapidly scaling workforce across multiple business units required moving away from manual, error-prone hiring handoffs. A poorly structured onboarding process introduces data inaccuracies, compliance gaps, and administrative delays that frustrate new hires and HR teams alike. To solve this, the practice implementation focused on building tailored Hire Templates and streamlined data-entry pathways.

By standardizing how employee and job data are captured from Day 1, Novocare ensures that every new team member whether permanent, contract, or intern is seamlessly integrated into the correct legal entity, department, and location with total data integrity.

5.1 Hire Template Configuration

Navigation Path:

Admin Centre > Manage Data > Create New > Hire Template > Enter Template ID, Effective Start Date, Status & Name > Configure Section Configurations > Add Required HRIS Blocks (e.g., National ID Information in First Step) > Configure Block Details > Save > Verify Hire Template Record

Objective:

To configure and control the step-by-step hiring process and the specific fields presented during employee creation.

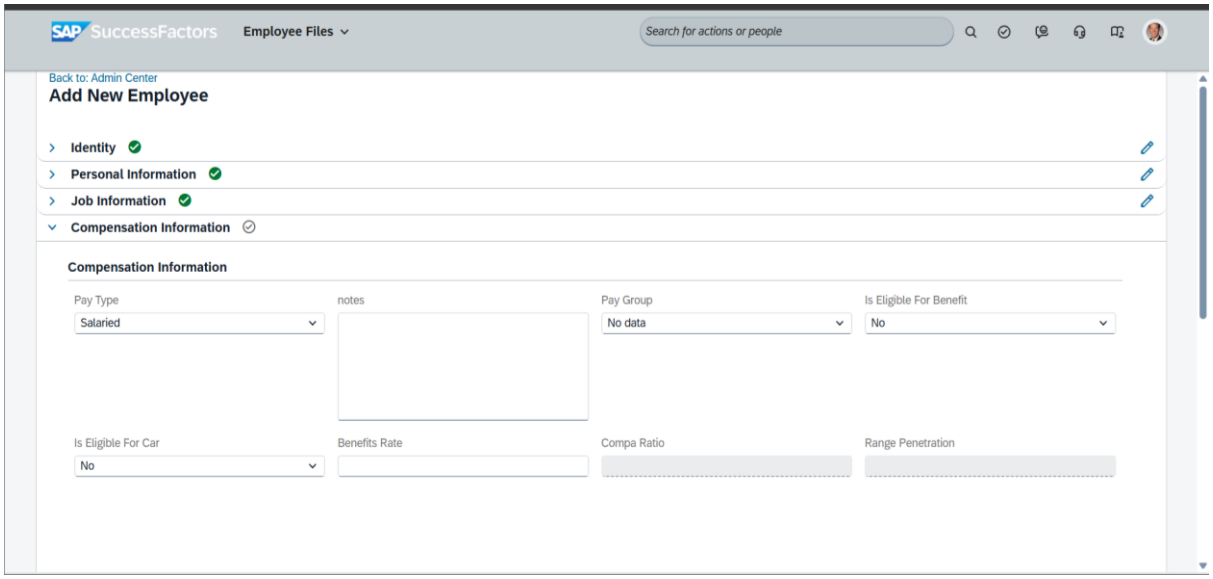

Configuration Areas:

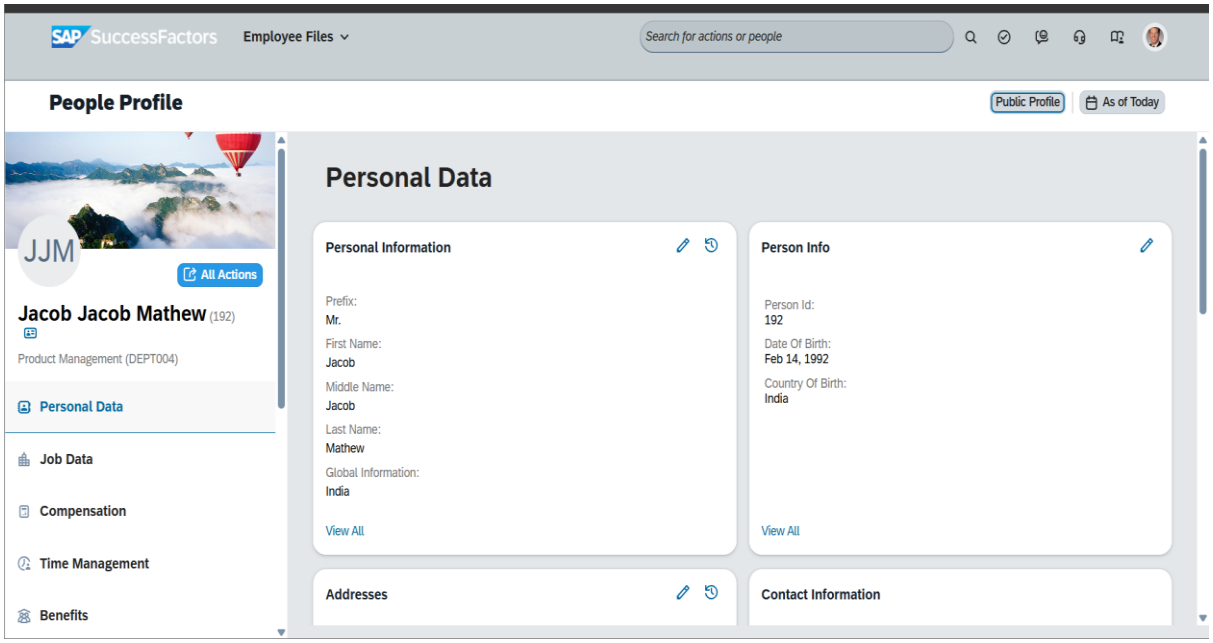

- New-hire process workflows and relevant template settings (such as NCT_Contract hire template NCT_Hire_02)
- Essential employee information fields and HRIS blocks (Identity info, Personal Details, Employment details)
- Job-related information and organizational assignments

Validation:

Reviewed the applied configuration to ensure that mandatory fields (such as National ID information) and intended data blocks were correctly surfaced during the employee hiring process.

5.2 Add New Employee

Navigation Path

Admin Center > Add New Employee (or via People Profile / Hire wizard)

Objective:

To practice and execute the end-to-end creation of a new employee record within Employee Central, ensuring seamless data capture from onboarding to active employment.

Key Activities:

- Entering required personal and identity information (such as name prefixes, first/middle/last names, and date of birth).
- Providing core employment and job information details.
- Assigning relevant organizational parameters, such as linking the employee to the correct Legal Entity (NCT001), Department (DEPT004), and Location (LOC003).
- Configuring compensation details (such as pay type, salary structures, and benefit eligibility).
- Reviewing all entered data across multiple wizard steps before finalizing and saving the record.

Validation:

Checked mandatory field compliance, verified successful database creation, and reviewed the resulting People Profile (e.g., verifying employee Jacob Jacob Mathew's profile data, organizational assignments, and job data).

06. BUSINESS RULES AND WORKFLOW CONFIGURATION

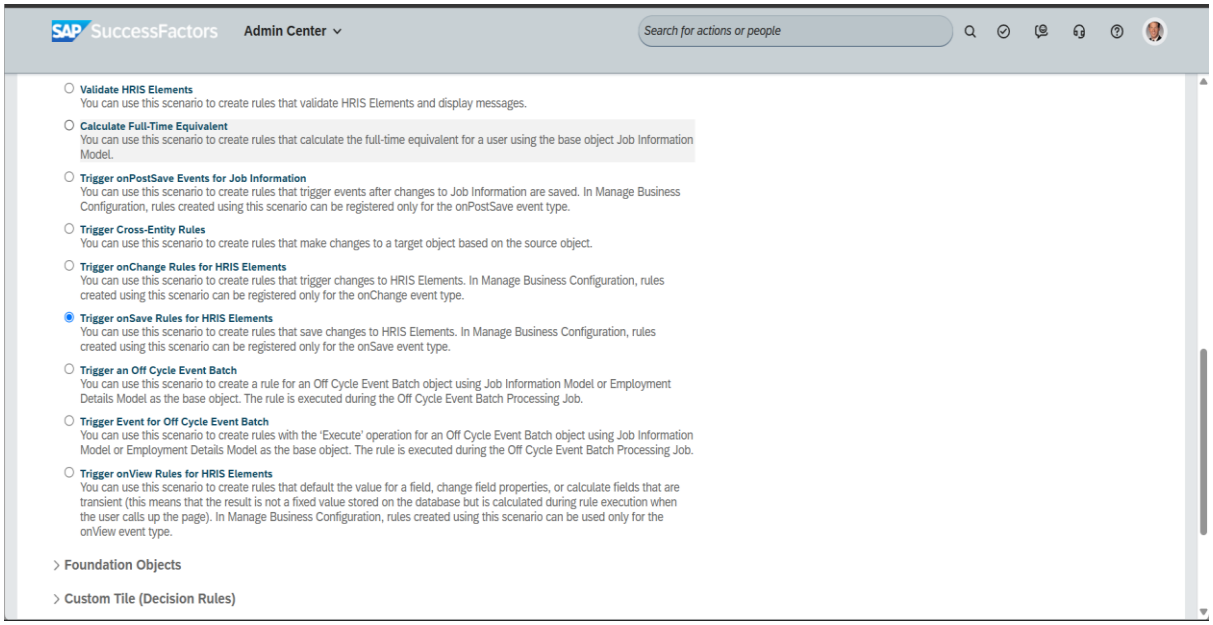

Project: Novacare Technology | Module: SAP SuccessFactors Employee Central

Overview & Business Context

Business Rules and Workflows drive process automation and governance in SAP SuccessFactors Employee Central. Business Rules apply real-time logic when specific conditions are met to maintain data integrity, while Workflows route critical HR transactions (such as transfers or promotions) through structured approval chains.

At Novocare Technologies, manual data entry often resulted in naming inconsistencies, while employee transfers stalled due to a lack of automated oversight. To eliminate these operational bottlenecks, custom business rules and multi-tier workflows with time-bound escalations were implemented.

6.1 Business Rule Configuration

Navigation Path:

Admin Centre > Configure Business Rules > Create New Rule > Select Scenario (e.g., Trigger onSave Rules for HRIS Elements) > Define Parameters, Conditions (If), and Actions (Then) > Save.

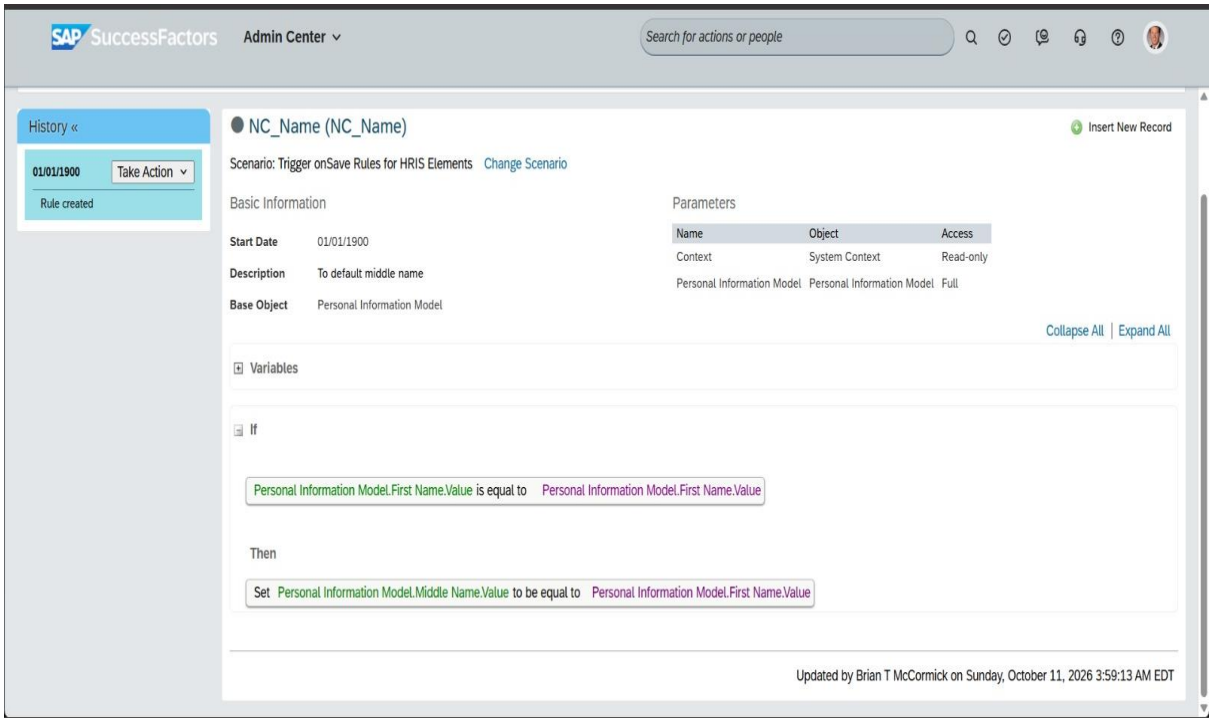

Objective:

To automate data formatting, enforce mandatory standards, and apply conditional HR logic during employee record creation or updates.

Configuration Areas & Practical Scenarios Implemented:

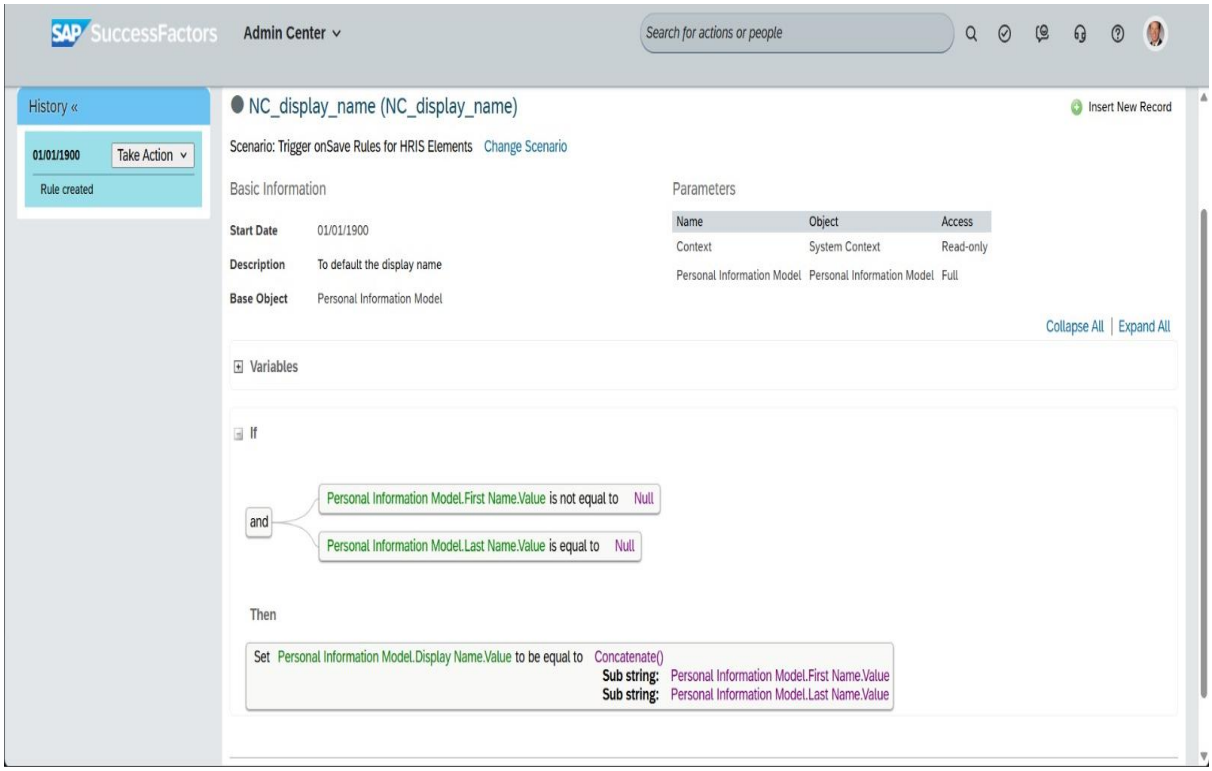

Rule 1: Name Formatting & Defaulting (NC_Name)

- Purpose: Configured under the *Trigger onSave Rules for HRIS Elements* scenario using the Personal Information Model base object.
- Logic: Evaluates if the First Name is populated and automatically defaults the Middle Name field to match the First Name value when required, minimizing manual keystrokes.

Rule 2: Automated Display Name Generation (NC_display_name)

- Purpose: Ensures consistent full-name formatting across the employee directory.
- Logic: Evaluates if the First Name is not equal to Null and the Last Name is equal to Null (or combines both), then executes a Concatenate() function to automatically populate the employee's Display Name field using both First and Last Name sub-strings.

Validation:

Tested rule conditions in the sandbox environment, verified successful triggering during onSave actions, and confirmed correct data output on the People Profile.

6.2 Workflow Configuration & Approval Routing

Navigation Path:

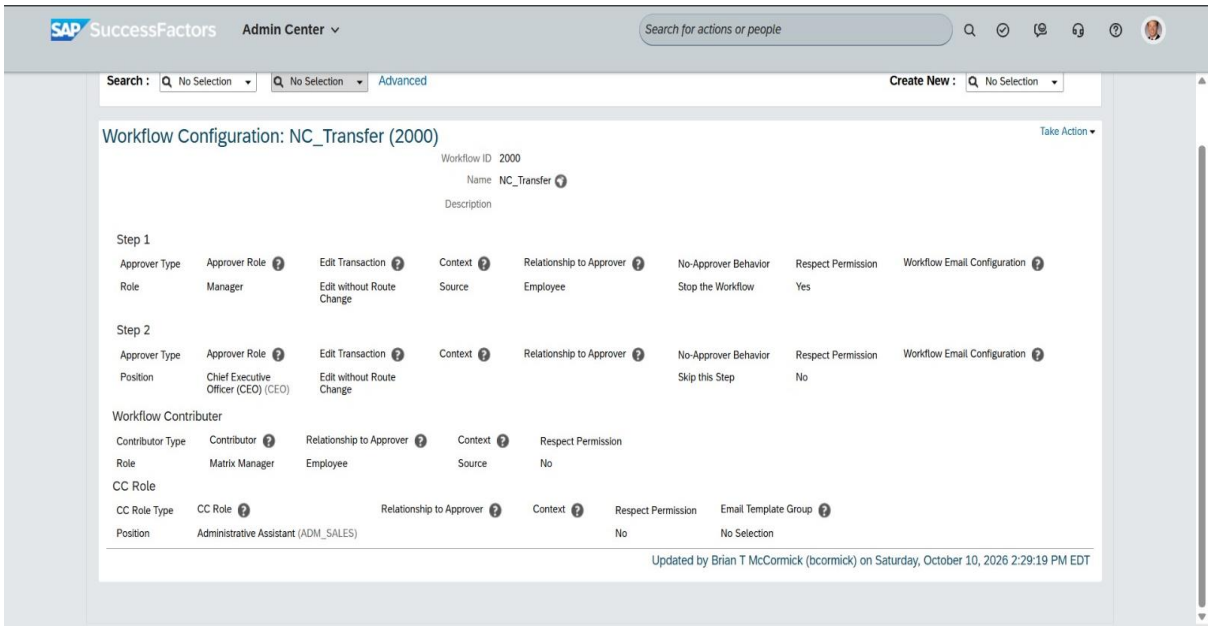

Admin Centre > Manage Organization, Pay and Job Structures (or Manage Data) > Workflow > Define Workflow ID (2000), Name (NC_Transfer), Step Details, Approvers, and Behavioral Rules.

Objective:

To govern organizational changes (such as job or department transfers) by routing transactions to the correct decision-makers with built-in fail-safes.

Configuration Areas:

- Step 1 Routing: Assigned to the employee's direct Manager with a *No-Approver Behavior* set to "Stop the Workflow" to maintain strict managerial oversight.
- Step 2 Routing: Escalates to the Chief Executive Officer (CEO) (Position-based approval) with a *No-Approver Behavior* set to "Skip this Step" for high-level executive visibility on major job changes.
- Contributors & CC Roles: Included Matrix Managers as Contributors and Administrative Assistants (ADM_SALES) in CC roles for transparent cross-functional communication.

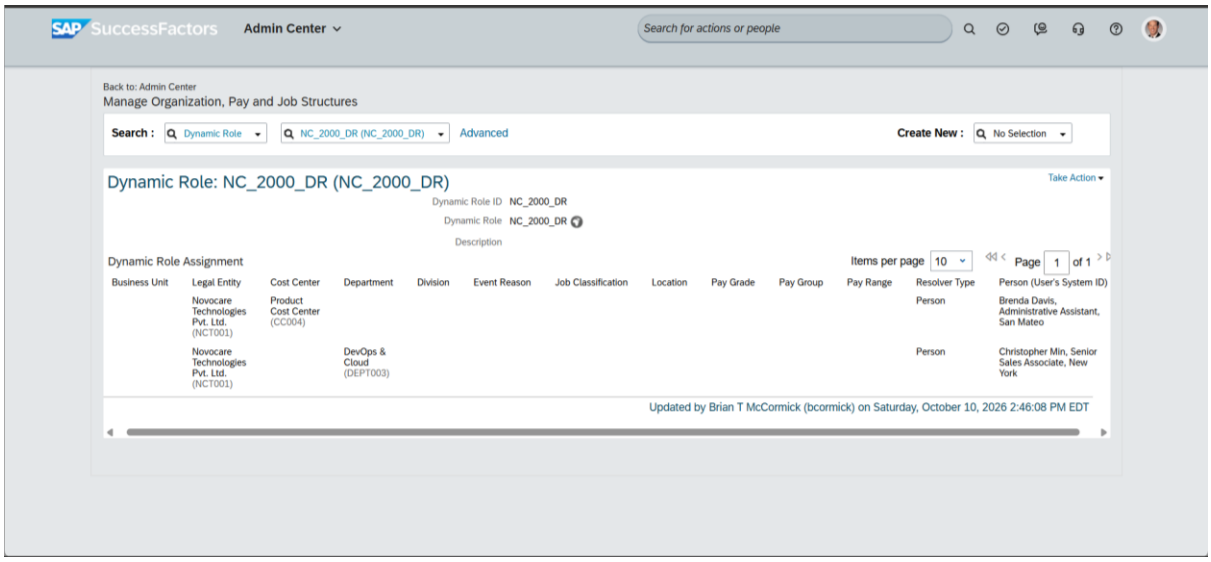

6.3 Dynamic Role Configuration (Workflow Approvers)

Navigation Path:

Admin Centre > Manage Organization, Pay and Job Structures > Dynamic Role

Objective:

Configured Dynamic Roles to route workflow approvals dynamically based on employee job details (e.g., dynamically resolving the specific HR Business Partner or Location Manager responsible for an approving step).

6.4 Dynamic Group (Workflow Group) Configuration

Overview:

In SAP SuccessFactors, a Dynamic Group (also referred to as a Workflow Group) is used specifically within workflow step configurations to define a group of users who can receive and approve workflow requests based on dynamic criteria (such as Department, Location, or Division) or explicit membership lists.

Navigation Path:

Admin Centre > Manage Workflow Groups > + Create New Group > Enter Group Name (NC_dynamic_group), Category & Group Description > Define Inclusion Criteria (People Pool / Category Filters) > Save.

Objective:

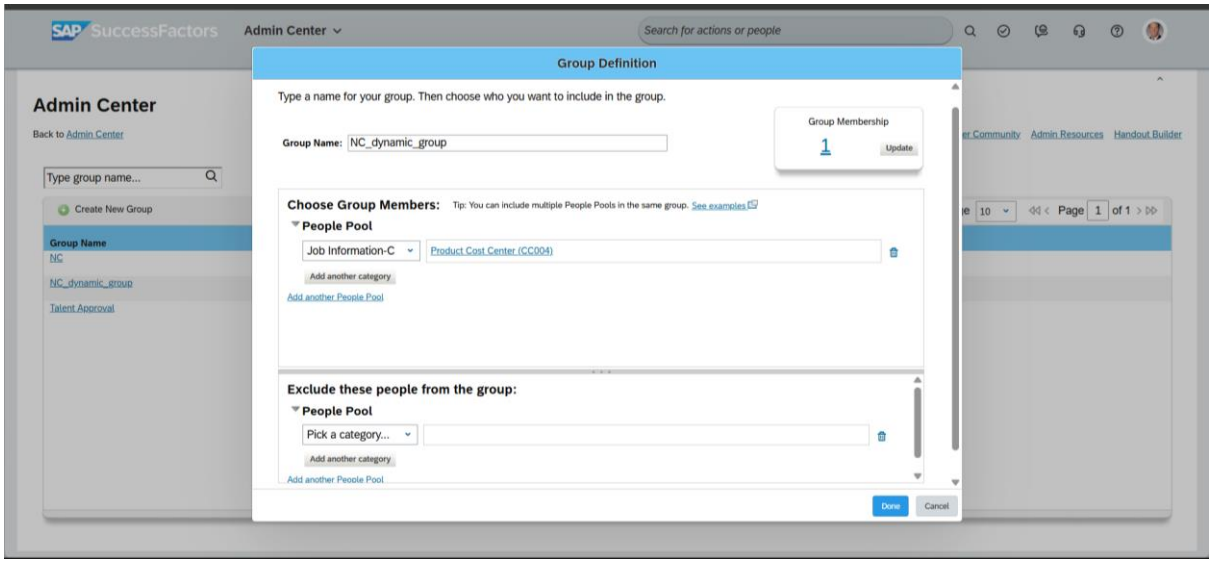

To establish rules-based, dynamic user groups for workflow approvals, ensuring that transactions automatically target the correct operational or cost-center population without manual membership maintenance

Configuration & Key Details:

- Group Naming & Identification: Configured a dynamic group titled NC_dynamic_group for the Novocare Technologies practice environment.
- People Pool Criteria: Configured inclusion rules leveraging HRIS data elements, specifically filtering by Job Information (Job Information-Cost Centre) to dynamically capture employees assigned to the Product Cost Centre (CC004).
- Exclusionary Rules: Maintained clean data boundaries by configuring optional exclusion filters to prevent out-of-scope personnel from entering the approval pool.
- Group Membership Verification: Utilized the real-time Group Membership counter (1 Member resolved) to validate that active employees meeting the cost-centre criteria were successfully included prior to workflow binding.

Validation:

Automates approver pool maintenance. As employees move into or out of CC004, their inclusion in NC_dynamic_group updates dynamically, eliminating administrative bottlenecks in workflow routing.

6.5 Escalation Configuration

Navigation Path:

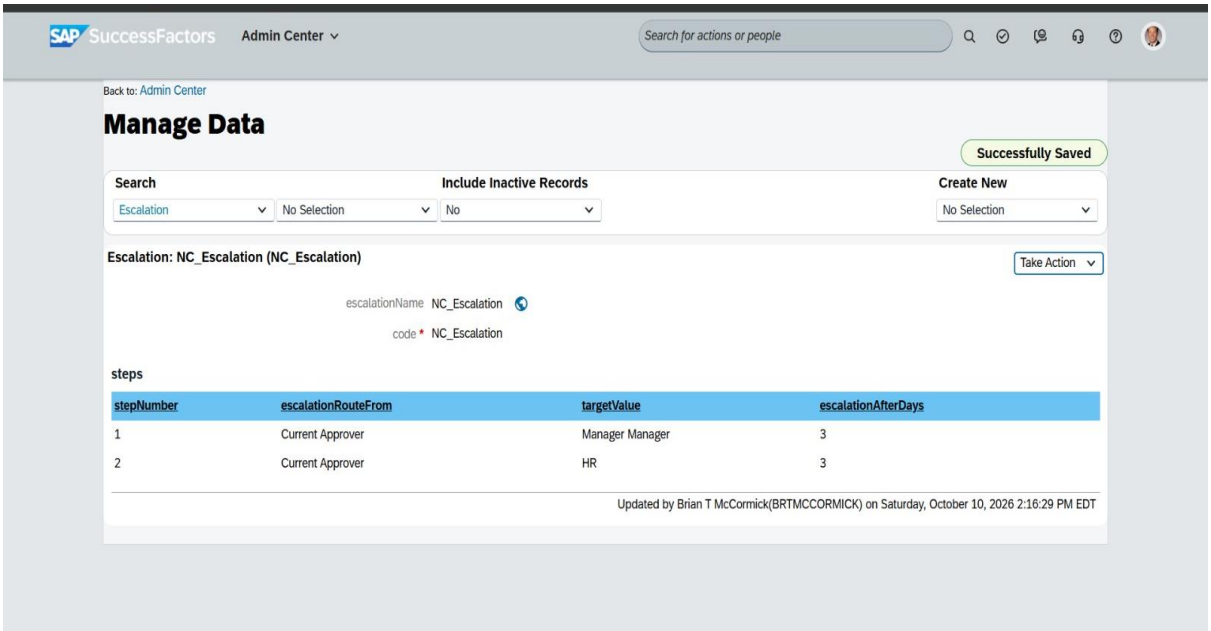

Admin Centre > Manage Data > Create New > Escalation > Configure Escalation Name (NC_Escalation), Step Numbers, Route From, Target Values, and Time Delays.

Objective:

To prevent administrative gridlock when managers fail to act on pending approvals.

Configuration Areas:

- Configured time-bound escalation triggers (escalationAfterDays = 3) for both Step 1 and Step 2.
- If a request sits unapproved by the Current Approver for 3 days, it automatically reroutes to higher-level authorities (**Manager Manager** and **HR**), ensuring internal mobility and transactions proceed without operational delay.

6.6 Business Impact & Value Delivered

- Elimination of Manual Errors: Automated onSave rules remove the burden of manual name and field formatting, ensuring pristine data quality across the entire employee directory.
- Mitigation of Approval Bottlenecks: Integrating multi-step workflows with strict 3-day escalation rules ensures that employee transfers and internal mobility never stall due to unresponsive approvers, maintaining business agility.
- Dynamic & Scalable Approver Routing: Utilizing Dynamic Roles and Workflow Groups (NC_dynamic_group linked to CC004) automates approval routing based on cost center and position criteria, eliminating the administrative overhead of hardcoding static individuals.
- Enhanced Governance & Transparency**:** Clear separation of duties between managers, executives, HR, and CC notification roles ensures complete accountability and audit readiness during organizational changes.

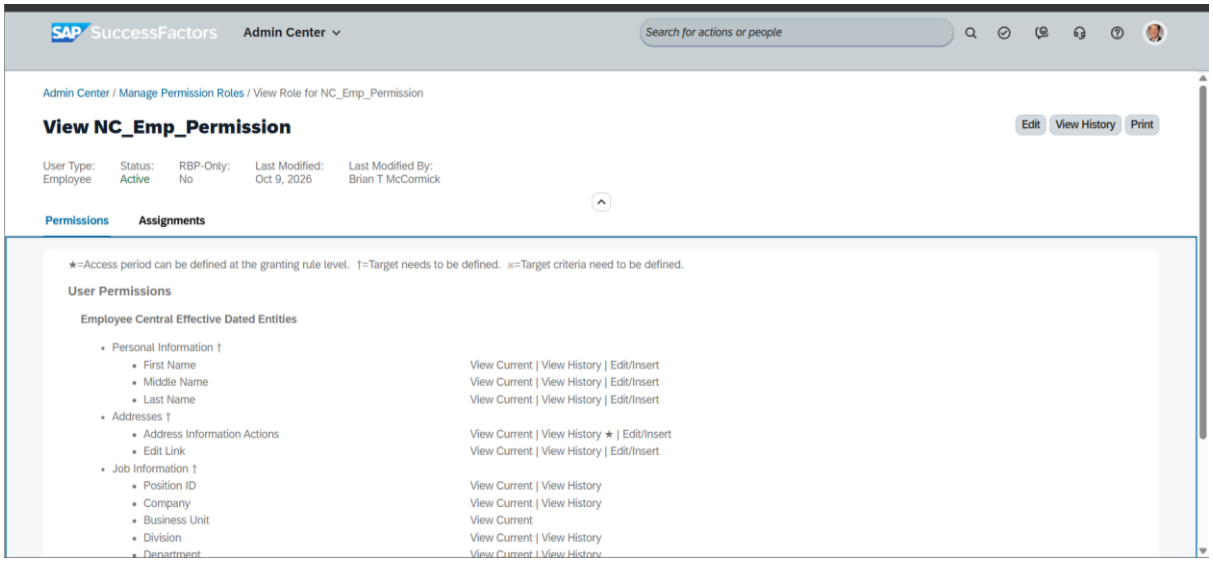

07.ROLE-BASED PERMISSIONS (RBP) AND SECURITY ADMINISTRATION

Project: Novocare Technologies Pvt. Ltd. | Module: SAP SuccessFactors Employee Central

Overview & Business Context:

Role-Based Permissions (RBP) form the security backbone of SAP SuccessFactors. They govern feature accessibility, data visibility, and administrative control across the enterprise. At Novocare Technologies, ensuring strict data privacy while enabling cross-functional transparency required designing a granular security architecture. RBP was leveraged to segregate duties between HR administrators, line managers, and executive leadership, restricting sensitive employee data access strictly to authorized personnel.

7.1 Permission Role Configuration

Navigation Path:

Admin Center > Manage Permission Roles > Select Role (NC_Emp_Permission).

Objective:

To define granular, field-level view and edit rights across core Employee Central Effective Dated Entities (such as Personal Information, Addresses, and Job Information).

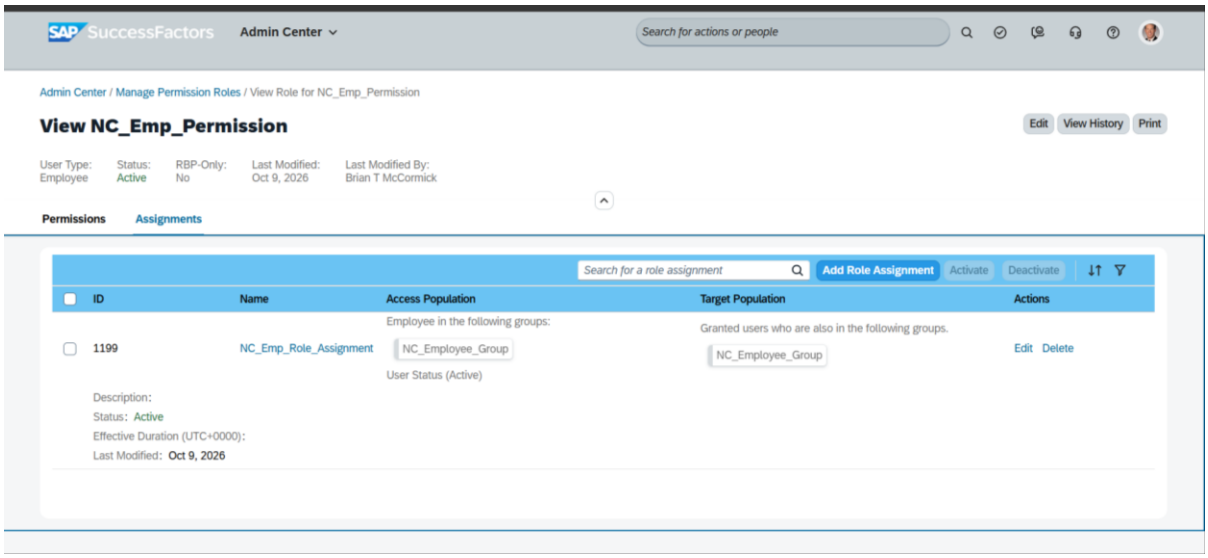

Configuration Areas & Implementation Details:

- Role Identification: Configured the active permission role titled NC_Emp_Permission.
- Personal Information Rights: Configured field-level permissions for core identity attributes (First Name, Middle Name, Last Name), granting explicit View Current, View History, and Edit/Insert privileges.
- Address Information & Actions: Assigned controlled access to address data blocks, including Address Information Actions and Edit Link visibility.

- Job Information Security: Configured precise read-only and historical visibility for structural elements including Position ID, Company, Business Unit, Division, and Department (setting permissions to *View Current* or *View History* to preserve data auditability).

Validation:

Verified that permission categories successfully enforce the principle of least privilege while providing employees and administrators with appropriate self-service and management capabilities.

7.2 Permission Group Configuration

Navigation Path:

Admin Center > Manage Permission Groups.

Objective:

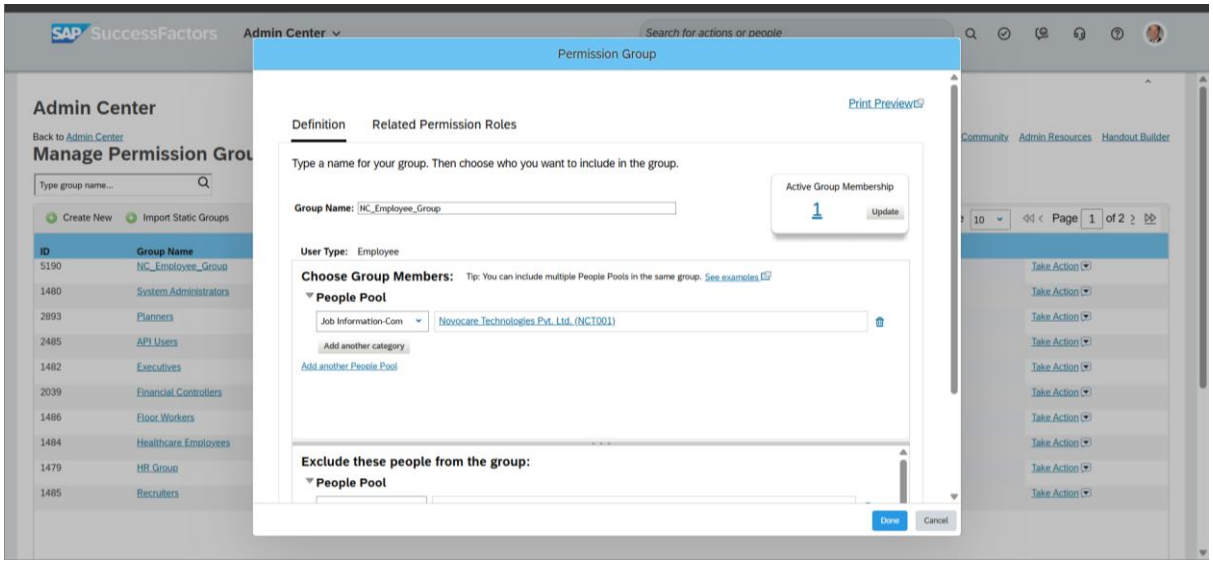

To establish dynamic user populations that automatically aggregate employees based on operational criteria rather than static user lists.

Configuration Areas:

- Group Naming & Identification: Created the custom group titled NC_Employee_Group.
- Membership Criteria (People Pools): Configured inclusion rules leveraging HRIS data filters (such as Legal Entity NCT001, Department DEPT004, or Location LOC003) to ensure group membership dynamically updates during organizational changes or onboarding.

Validation:

Confirmed that dynamic membership rules successfully evaluate and resolve active employee populations in real time

7.3 Permission Role Assignments & Target Populations Workflow

Navigation Path:

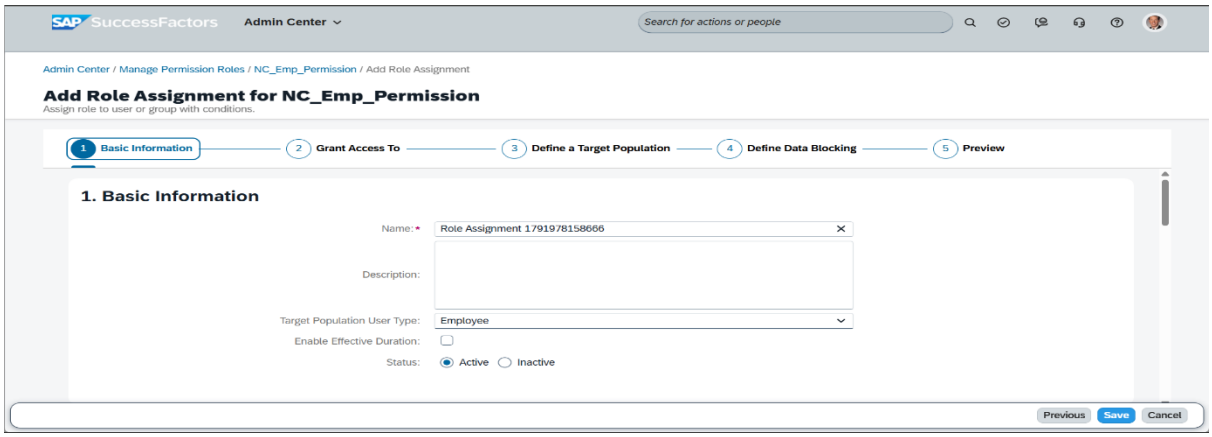

Admin Center > Manage Permission Roles > Select Role (NC_Emp_Permission) > Assignments tab > Add Role Assignment (5-Step Guided Wizard).

Objective:

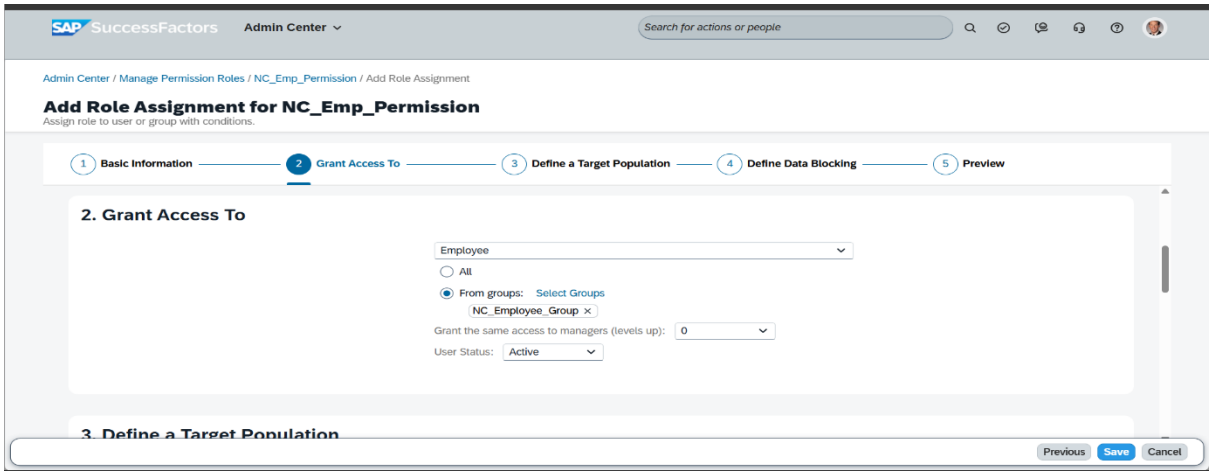

To bind the NC_Emp_Permission role to active users and establish target population boundaries using the latest SAP SuccessFactors RBP configuration wizard.

5-Step Configuration Process:

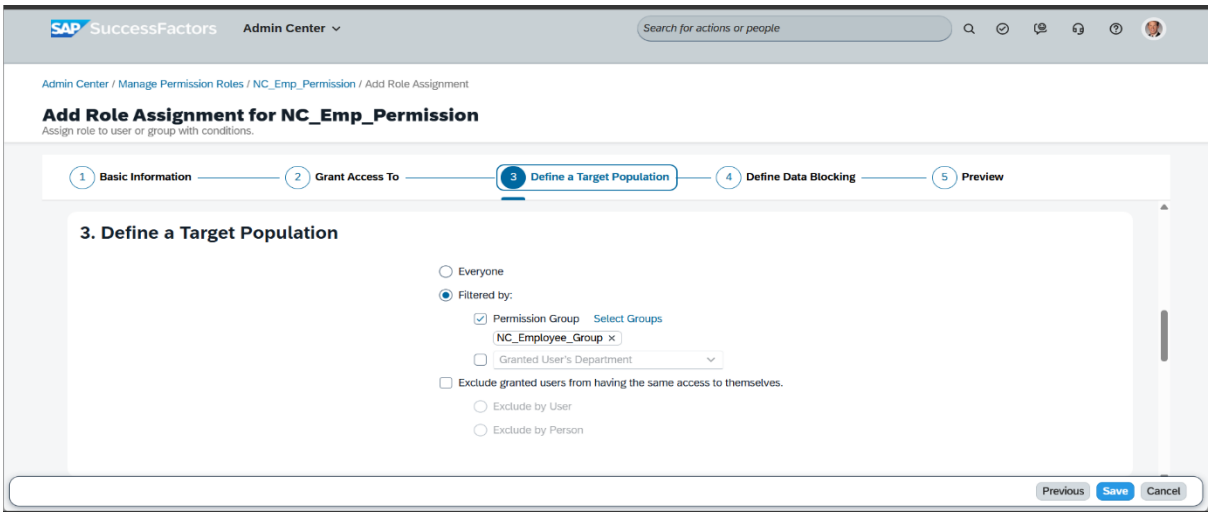

- Basic Information: Defined assignment status as Active for target user type Employee.

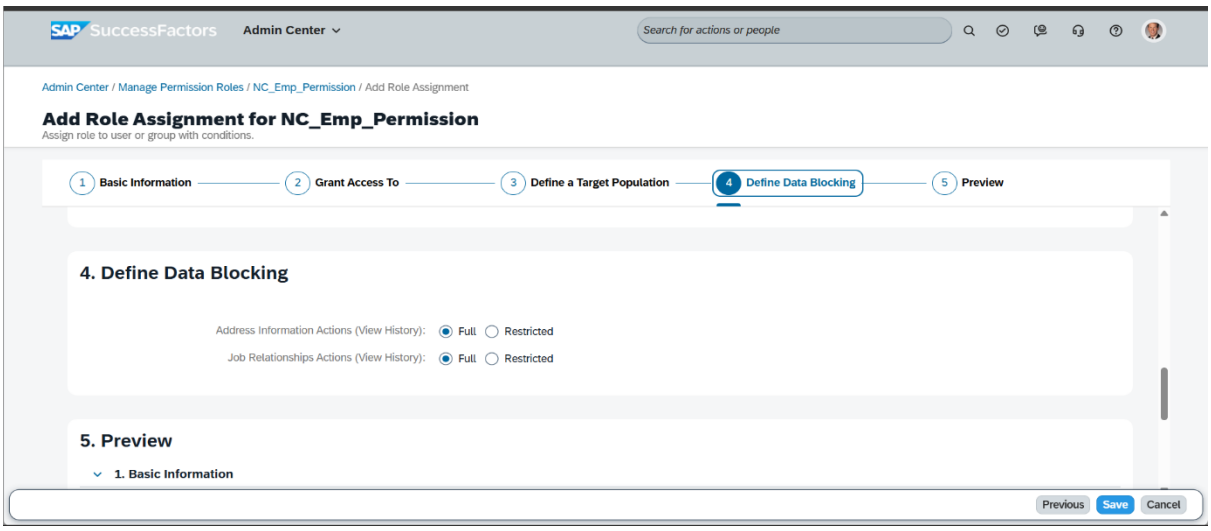

- Grant Access To: Restricted the granted access population exclusively to members of the NC_Employee_Group permission group with an *Active* user status (selecting *From groups: NC_Employee_Group* instead of granting to all employees), ensuring only designated workforce members inherit the permissions.

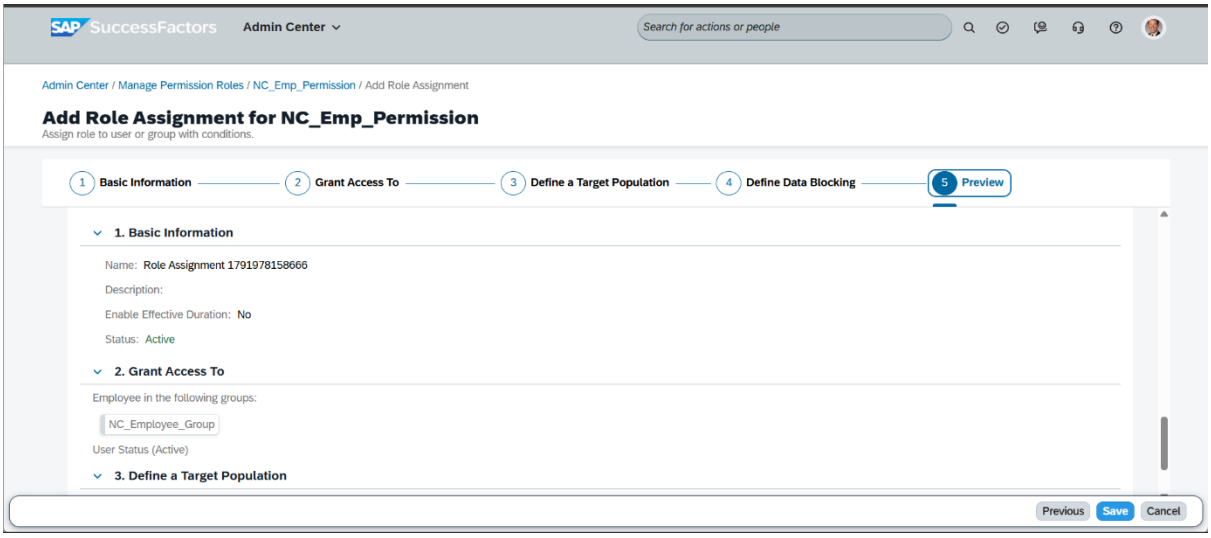

- Define Target Population: Restricted data access boundaries by filtering target records specifically to members of NC_Employee_Group.

- Define Data Blocking: Evaluated historical action restrictions for sensitive entities, maintaining Full access rights for address and job relationship audit trails.

- Preview & Finalize: Executed a system pre-save audit reviewing all assignment parameters prior to committing changes to the production instance.

Validation:

Verified via the assignment preview screen that NC_Employee_Group members are strictly constrained to view and edit records within their designated group target population.

7.4 Business Impact & Value Delivered

- Enforcement of the Principle of Least Privilege: By scoping both the access population (*Grant Access To*) and target population strictly to NC_Employee_Group, permissions are granted only to authorized personnel and constrained strictly to authorized employee records.
- Field-Level Data Privacy & Compliance: Explicit read/write controls across personal identity and job fields (such as First Name, Middle Name, Position ID, and Company) prevent unauthorized viewing or editing of sensitive employee details, ensuring alignment with enterprise data protection standards.
- Controlled Auditability via Data Blocking: Utilizing step-by-step data blocking rules preserves historical change logs for critical entities (like Address Information and Job Relationships), safeguarding data auditability without exposing unneeded administrative permissions.
-
- Dynamic Security Scalability: Associating permission roles with dynamic groups (NC_Employee_Group) eliminates manual permission maintenance during onboarding, transfers, or offboarding, drastically reducing IT/HR administrative overhead.

08 POSITION MANAGEMENT & ORGANIZATIONAL HIERARCHY CONFIGURATION

Project: Novocare Technologies Pvt. Ltd. | **Module:** SAP SuccessFactors Employee Central

Overview & Business Context:

As Novocare Technologies Pvt. Ltd. expands its global operations, managing workforce strategy solely through traditional employee-to-manager reporting lines introduced operational friction and reporting gaps whenever turnover occurred. To establish strict headcount control, budget accountability, and seamless organizational continuity, Position Management was configured as the architectural foundation of the Employee Central tenant. By decoupling job positions from individual incumbents, Novocare maintains an unbroken organizational structure and automates data flow during hiring and internal moves.

9.1 Position Object & Attribute Definition (MDF)

Navigation Path:

Admin Center > Manage Data > Create New > Position.

Objective:

To build standardized, reusable position records that encapsulate organizational, job, and financial attributes independently of employee records.

Configuration Areas & Implementation Details:

- **Position Identification:** Defined core position parameters, assigning unique IDs (e.g., POS_HR_004, POS_FIN_002) and standardized job titles.
- **Organizational Mapping:** Linked each position directly to Novocare's established corporate framework-attaching Legal Entity (NCT001), Department (DEPT004), Division, Location (LOC003), and Cost Centre (CC004).
- **Headcount & Quantity Settings:** Configured position target quantities (Target FTE = 1.0, Position Quantity = 1), enforcing strict budget caps per role.

Validation:

Verified via Manage Data that position records save successfully with all mandatory corporate attributes bound correctly.

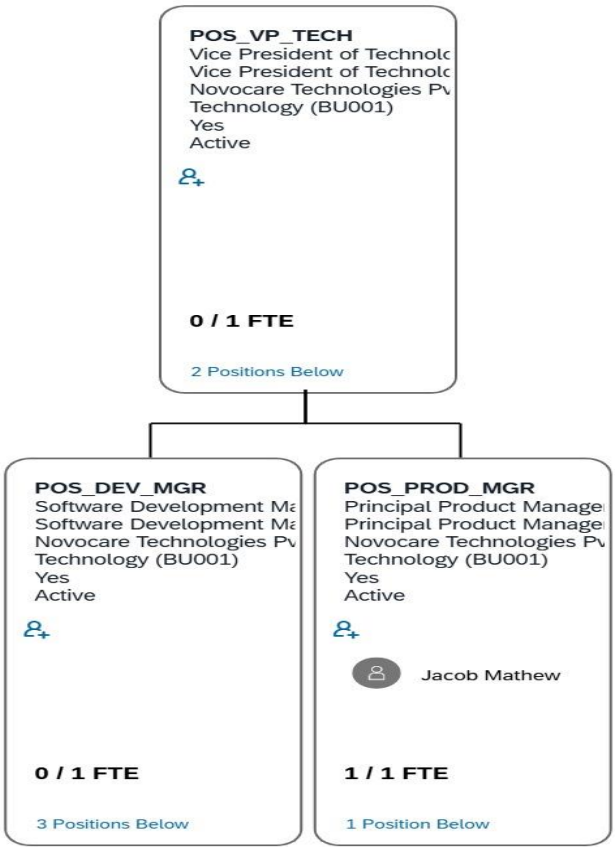

9.2 Position Hierarchy & Position Org Chart

Navigation Path:

Company Info > Position Org Chart.

Objective:

To build a structural parent-child hierarchy where positions report directly to higher-level positions, ensuring structural stability regardless of personnel changes.

Configuration Areas & Implementation Details:

- **Parent Position Assignment:** Linked child positions to parent positions (eg: linking *Senior HR Specialist Position* directly to *HR Director Position*).
- **Matrix & Reporting Structures:** Configured position-level reporting lines to automatically dictate managerial relationships when employees are hired into positions.

Validation:

Navigated the graphic Position Org Chart interface to verify that parent-child position trees render correctly and display real-time incumbent statuses.

9.3 Position-to-Job Information Data Propagation

Navigation Path:

Admin Center > Configure Business Rules / Manage Business Configuration (BCUI).

Objective:

To automate data entry during hiring and transfers by automatically populating job fields from the selected position record into the employee's Job Information.

Configuration Areas & Implementation Details:

- **Propagation Rule Logic:** Created an onChange business rule on the Position field in Job Information.
- **Rule Mapping:** Configured the rule action:
    - **IF:** Job Information.Position IS NOT EMPTY AND IS CHANGED.
    - **THEN:** SET Job Info.Department = Position.Department, SET Job Info.Cost Center = Position.Cost Center, SET Job Info.Location = Position.Location, and SET Job Info.Business Unit = Position.Business Unit.

Validation:

Simulated a new hire workflow to confirm that choosing a Position ID instantly populates Department, Cost Centre and Location fields without manual typing.

9.4 Vacancy Management & "To-Be-Hired" Automation

Navigation Path:

Admin Centre > Position Management Settings.

Objective:

To automate vacancy tracking and recruitment signaling whenever positions are created or incumbents depart.

Configuration Areas & Implementation Details:

- **To-Be-Hired Status Control:** Configured automatic status toggles:
    - When an incumbent resigns, transfers out, or is terminated, the position's To-Be-Hired status automatically flips to **Yes**.
    - When a new hire is successfully processed into the position, the status automatically reverts to **No**.
- **Requisition Triggering:** Integrated vacancy state changes to allow instant requisition opening for talent acquisition teams.

Validation:

Verified position records post-termination test scenarios to confirm To-Be-Hired automatically switched to Yes upon exit processing.

9.5 Business Impact & Value Delivered

- Precise Headcount & Budget Governance: Prevents unbudgeted hiring by enforcing strict position quantity caps across Novocare departments.
- Zero Data Entry Errors: Automated Position-to-Job Info propagation guarantees 100% data consistency between organizational structures and employee profiles.
- Unbroken Structural Hierarchy: Position-based reporting maintains org chart continuity during management transitions without breaking supervisory trees.
- Instant Recruitment Visibility: Automated vacancy toggles (To-Be-Hired = Yes) streamline recruiting workflows and accelerate time-to-fill for critical open seats

09 USER EXPERIENCE (UX), BRANDING & SYSTEM CUSTOMIZATION

Project: Novacare Technology Module: SAP SuccessFactors Employee Central

Overview & Business Context:

To ensure high user adoption, seamless daily navigation, and strong corporate identity alignment for Novocare Technologies Pvt. Ltd. The SuccessFactors user experience was comprehensively customized. This spanned visual branding, home page dashboard optimization, BCUI profile adjustments, and custom MDF object rendering on the Live Profile.

9.1 Theme Manager & Corporate Branding

Navigation Path:

Admin Centre > Theme Manager.

Implementation Details:

- Applied professional corporate branding to match Novocare Technologies' visual identity.
- Customized header colors, background login screens, and button styling, and embedded the official NCT corporate logo across the tenant.

9.2 Home Page, Quick Actions & Custom Tiles

Navigation Path:

Admin Centre > Configure Home Page.

Implementation Details:

- **Quick Actions:** Pinned top-priority shortcuts (*Request Time Off*, *View Org Chart*, *Team Directory*) to the top of the dashboard for quick task execution.
- **Custom Tiles & Surveys:** Created targeted informational tiles and integrated employee pulse surveys to support internal company communications and feedback collection.

9.3 Business Configuration UI (BCUI) & Portlet Customization

Navigation Path:

Admin Centre > Manage Business Configuration.

Implementation Details:

- Tailored standard HRIS elements (jobInfo, personalInfo).
- Enforced data integrity by configuring mandatory field constraints (e.g., making *Cost Centre* and *Location* required fields during data entry).

9.4 Custom MDF Objects & Live Profile Integration

Navigation Path:

Admin Centre > Configure Object Definitions > Configure People Profile.

Implementation Details:

- Built a custom Metadata Framework (MDF) object (NCT_Company_Assets) to track corporate-issued equipment.
- Configured Live Profile MDF portlets to render the custom asset tracking block directly onto the employee profile page for easy administrative review.

9.5 Configuration Transport & Instance Management

Navigation Path:

Admin Centre > Configuration Centre / Instance Sync.

Implementation Details:

- Used transport tools to safely migrate UI configurations, custom tiles, and business rules from the development environment to the testing instance without manual re-entry.

9.6 Business Impact & Value Delivered

- Accelerated User Adoption: A clean, branded interface with prominent quick actions minimized training time and improved daily efficiency for NCT employees.
- Extended System Flexibility: Custom MDF objects and Live Profile portlets bridged gaps in standard SAP functionality to meet unique internal tracking needs.

10 | DATA MANAGEMENT, IMPORT/EXPORT & VALIDATION

Project: Novocare Technologies Pvt. Ltd. | **Module:** SAP SuccessFactors Employee Central / Platform

Overview & Business Context:

To ensure a seamless transition from legacy systems to the new SAP SuccessFactors tenant for Novocare Technologies Pvt. Ltd**.** A structured data migration and rigorous testing strategy was executed. This phase governed bulk data loading via the Import/Export framework and validated functional behaviour across business rules, workflows, and position structures prior to go-live.

10.1 Employee & Configuration Data Import/Export Framework

Navigation Path:

Admin Centre> Import Employee Data / Import and Export Data.

Implementation Details:

- Template Generation & Data Preparation: Downloaded standard CSV templates for core HRIS entities (including *User Directory*, *Personal Information*, and *Job Information*), cleansing and mapping Novocare's legacy workforce data to match SuccessFactors data types and picklist values.
- Bulk Data Migration: Executed staged batch imports for foundational data, organizational structures, and employee profiles, validating import logs to resolve formatting or dependency errors instantly.

10.2 Configuration Validation & Diagnostic Tools

Navigation Path:

Admin Centre > Check Tool / Import Employee Data Check.

Implementation Details:

- Utilized the SuccessFactors Check Tool to run automated diagnostic health checks across Employee Central components, identifying and resolving configuration mismatches or broken object relationships prior to system release.
- Verified audit logs for business rules and workflow configurations to ensure system integrity.

10.3 Functional Testing & End-to-End Result Verification

Navigation Path:

Test instance execution across Add New Employee and Position Org Chart.

Implementation Details:

- **Scenario-Based Testing:** Executed end-to-end test scripts simulating real-world HR transactions (e.g., executing a hire action to test Position-to-Job Info propagation, submitting leave requests to verify workflow routing, and checking vacancy status toggles).
- **Result Verification:** Confirmed that system outputs matched Novocare's business requirements, ensuring accurate data flow from positions down to employee profiles and payroll-ready fields.

10.4 Business Impact & Value Delivered

- Flawless Cutover Execution: Structured CSV import sequences eliminated manual data entry backlogs and ensured high data accuracy during migration.
- Risk Mitigation**:** Comprehensive validation via the Check Tool and functional testing prevented configuration errors from reaching the production environment.
- System Readiness: Guaranteed that all customized workflows, rules, and UI elements functioned reliably for Novocare end users upon go-live.

PROJECT CONCLUSION & SUMMARY

What We Achieved: Successfully built a complete SAP SuccessFactors Employee Central system from scratch for Novocare Technologies. We solved key business problems by automating hiring, improving tracking, and making the system clean and easy for employees to use.

Key Takeaways from the Novocare Project:

- Strong Foundation: Set up secure data models and organizational structures to keep employee records accurate and protected.
- Smart Automation: Used positions and business rules to automatically fill out job details, track vacancies, and calculate leave days without manual paperwork.
- Great User Experience: Designed a modern, branded home page with quick buttons so employees and managers can do their daily tasks in seconds.
- Clean Data & Testing: Safely imported employee data using templates and tested the system thoroughly to make sure everything worked smoothly.

This project demonstrates the ability to translate real business needs into a fully functional, efficient, and user-friendly SAP SuccessFactors environment from end to end.
